

The two-way communication included in tekmarNet® systems opens up a world of options for temperature control. Through communication, access to system wide heating and cooling settings can be provided through a web browser, home automation system or wall mounted switch. Your customers can choose from three convenient options:

A Gateway 483e enables web browser access to heating and cooling settings from anywhere in the world. Customers can conveniently set the temperatures back while on vacation and bring their systems out of energy saving mode before arriving back home. Contractors can also take advantage of the ability to view temperature trends and make adjustments remotely. An 'always on' internet service is required to access the system through the internet. For customers who want to control the system from their home computer, all that is needed is an internal connection to the Gateway server. For complete details, refer to the [Installation Manual D483e](#).

A Gateway 482e provides access to tekmarNet® room controller settings through a home automation system. Customers can view and adjust room temperature settings with the same remote control, touch screen or software application that controls lighting, entertainment and security settings. Contact your local representative to enquire about home automation brands.
